Aurora Labs — Company Briefing

Aurora Labs is a privately held software company founded in 2019. The company is headquartered in Reykjavik, Iceland, and operates a single research office there. As of the latest briefing it employs 42 people across engineering, research and operations.

Product

Aurora Labs develops a single flagship product named Lumen. Lumen is an on-device observability platform that analyses telemetry from industrial sensors without sending raw data off-site. Lumen was first released to customers in 2021 and is licensed on a yearly subscription basis.

Leadership and structure

The company is led by its founder and chief executive, and remains independent with no outside acquisition. Engineering is organised into three small teams: ingestion, analytics and platform. Aurora Labs has never opened a second office and does all of its manufacturing partnerships remotely from Reykjavik.

Positioning

Aurora Labs positions Lumen against cloud-first monitoring suites by keeping computation local, which the company argues reduces both latency and data-transfer cost for factory deployments. Its typical customer runs Lumen on the edge, close to the sensors it observes.
